

HYPERTEST

FEATURES BRIEF

Automatically generate, update and maintain end to end tests for your APIs using real network traffic.

Only HyperTest, with its unique approach to API regression, can discover every API error for developers before release. The HyperTest platform monitors your entire application traffic, builds integration tests and exposes API failures and incidents. Here are a few of our features that stand us out:

Single Dashboard for all Micro-services

HyperTest sets-up for every service individually and monitors all incoming traffic to generate these end to end API tests. But it onboards and manages all micro-services in a single view .Provides run-time observation of all APIs and services for operations, development and testing teams

Network-denominated coverage reports

HyperTest monitors actual production traffic to discover the most commonly used flows and give teams the most accurate measurement of the API coverage of their test suite

1/100th test execution with De-duplication

HyperTest monitors user-traffic real-time and can record millions of user-actions across thousands of user-journeys (test cases) covering several workflows without break. But its AI de-duplicates non-unique user sessions to generate the minimum number of test sessions that can provide the maximum coverage. Saves several hours in test execution time.

True 'shift-left' testing with CI integration

HyperTest can help devs green-light a new release in << 5 mins. How, it integrates with your CI / CD tool and automatically triggers its service-based tests from the smallest commit or PR. These tests take 1/00th the time because they are localised to a single service, and give a single snapshot of all breaking changes in that build

Bug-tracker

Live repository all functional and performance issues that integrates with Jira and other bug tracking tools.

Complete security of test (user) data

HyperTest sets-up natively and keeps all the test (user) data used during testing completely secure inside the client's servers, maintaining the highest standards of secrecy for all sensitive user data

SCAN TO SCHEDULE A DEMO TODAY

HyperTest is a no-code test automation tool that regresses all your APIs by auto-generating integration tests using your network traffic without asking teams to write a single line of code, also giving a way to reproduce these failures inside actual user-journeys.
